# Soil and Water

Pupil sheet

**Name:** _____ **Date:** _____

**Safety:** Keep the box away from water; only the tip of the probe goes into the soil or the glass.

## 1. What I see on the screen

On the screen I see the **soil wetness** in per cent: 0 % means the probe is in air, 100 % the probe is in water. For that to be true, I first **calibrate** the probe.

**My calibration:** in air _____ in water _____ (the numbers next to the box, on the screen)

**Three rules.** I push the probe in **up to the line**, the same way every time. I do not pour water straight onto the probe. I wait ten seconds before I capture.

## 2. What I do on my own

**First I predict. I do not change my prediction after I measure.**
The fastest to get wet will be: ☐ the sand ☐ the garden soil ☐ the clay.
After 5 minutes the most water will be held by: ☐ the sand ☐ the garden soil ☐ the clay.

**My pots** (wetness, in %).

| Pot | Dry | Highest | After 5 min | Water held |
|---|---|---|---|---|
| 1 _____ | | | | |
| 2 _____ | | | | |
| 3 _____ | | | | |

**Water held** = after 5 min − dry. Example: $40 - 5 = 35$ %.

## 3. The conclusion I write

I predicted that, and the data show that _____

_____

**The order of the soils**, from the one that holds water best: _____, _____, _____

I think this is so because the grains _____

**The limit of our measurement:** which part of the pot does the probe see?

**Exit ticket**

Which soil would you plant a thirsty plant in, and why?
